The cornea is the clear, dome-shaped outer layer of the eye. It helps to focus light on the retina. The pupil is the black hole in the center of the eye. It is surrounded by the iris, which is the colored part of the eye. The lens is a clear, flexible structure that helps to focus light on the retina. The retina is the light-sensitive tissue that lines the back of the eye. It contains millions of cells that convert light into electrical signals that are sent to the brain.

## How Do Eyes Work?

When light enters the eye, it passes through the cornea and the pupil. The lens then focuses the light on the retina. The retina converts the light into electrical signals that are sent to the brain. The brain interprets these signals and creates an image of the world around us.

## **Common Eye Problems**

There are a number of common eye problems that can affect people of all ages. These problems can include:

\* Nearsightedness (myopia): This is a condition in which people can see objects close to them clearly, but objects far away appear blurry. \*

Farsightedness (hyperopia): This is a condition in which people can see objects far away clearly, but objects close to them appear blurry. \*

Astigmatism: This is a condition in which the cornea is not perfectly round.

This can cause blurred vision at all distances. \* Glaucoma: This is a condition in which the pressure inside the eye is too high. This can damage the optic nerve and lead to blindness. \*

Cataracts: This is a condition in which the lens of the eye becomes cloudy. This can cause blurred vision, glare, and difficulty seeing in low light. \*

Macular degeneration: This is a condition in which the macula, the central part of the retina, is damaged.

This can cause loss of central vision.

## **How to Get Rid of Eye Problems**

There are a number of different ways to treat common eye problems.

These treatments can include:

\* Eyeglasses or contact lenses: These can help to correct vision problems such as nearsightedness, farsightedness, and astigmatism. \*

Surgery: This may be necessary to treat glaucoma or cataracts. \*

Medication: This may

be used to treat eye infections or inflammation. \* Lifestyle changes: These can include things such as eating a healthy diet, getting regular exercise, and protecting your eyes from the sun.

Eyes are one of the most important parts of our body. They allow us to see the world around us and to interact with it. By understanding how eyes work and by taking steps to protect them, we can help to ensure that we have healthy vision for life.
